Tell us About Your Dream Job

Harsheet Singh Choudhary | Student ID: 25748601

43030 Professional Practice in Computing — Assessment Task 1: Professional Learning Plan

Why these jobs?

In your own words, below, describe why you've chose these jobs.
Questions to consider may include: What is it about these jobs that inspire you? Is there a particular skill that you want to develop or practice that is part of this job? What motivates you about the chosen role or company?

Job 1: Senior Machine Learning Engineer, PetSure (Australia) Pty Ltd, Chatswood, Sydney NSW (SEEK, posted 5 days ago).

Job 2: Senior Data Scientist, Real Time, Sydney NSW (SEEK, posted 5 days ago).

I am in my second year of a Bachelor of Information Technology at UTS, majoring in Data Analytics, and I want to end up in applied machine learning rather than reporting. These two ads describe the two halves of that.

The PetSure role is where I want to get to. It says outright that it is not a research-only job: it covers the whole ML lifecycle, from defining the problem through to deployment, monitoring and improving the model once it is live. That last part is the bit I cannot do yet. I am learning to train models in notebooks this session. What I would have no idea how to do is put one in front of real users and keep it working. The ad also lists responsible AI and governance as an actual responsibility rather than a footnote, which I did not expect from an insurer.

The Real Time role is the layer underneath. It is schema design, building the data warehouse, and documenting transformation frameworks in SQL, Python, Snowflake and dbt. My Database Fundamentals assignment and the preprocessing work in Introduction to Data Analytics were the very beginning of this. Reading the ad made it obvious how much further it goes.

I ruled two other things out. Business intelligence and reporting analyst roles stop at the dashboard, and I do not want to stop there. I also found a machine learning systems engineering role built on C++, Rust, CUDA and MLIR. Interesting, but it is compiler and hardware work, and nothing I have built so far points that way.

Both ads want someone who can explain technical work to people who do not do technical work. I have done a fair amount of that already, through customer-facing jobs and a market research internship, but always informally. I would rather practise it on purpose.

UTS CRICOS PROVIDER CODE 00099F

Skills Audit

In the table below add the key skills/ criteria and complete your skills audit.

In addition to the skills and criteria identified in the job ads. UTS have identified some key skills, based on the Australian Computer Society accreditation requirements and other sources, that we feel all professional staff should have. These have been added to the audit below

Key Skills/ Criteria	Current SFIA level	Evidence or Credible Plan
Understanding of ethical principles and practices, especially in relation to Indigenous Communities ***(Required)***	None – no prior level	No formal evidence in this area. The closest I have come is stakeholder identification and prioritisation in Business Requirements Modelling, which never touched Indigenous engagement, consent or cultural authority. Action: Goal 1 — complete the Working Ethically in the IT Industry and Indigenous Professional Capability modules, then write a 1,000-word analysis of consent and bias risk in an insurance ML model (45 hrs).
Foundational skills in Cybersecurity ***(Required)***	None – no defined level yet	I have never studied security, so I cannot evidence SFIA Level 1 in it. 41092 Network Fundamentals gave me protocol layers, IP, routing and the link layer, which is the model security controls sit on top of, but the subject had no security content. 31271 Database Fundamentals was ER modelling, normalisation and SQL, not access control. Gap: security goals and risk assessment, threat modelling, cyber threat intelligence, secure coding, secrets and credential handling, privacy obligations. Action: Goal 2 — the Introduction to Cybersecurity module in full (three assessments), plus a threat model and a credential-handling refactor of an existing project (45 hrs).
Foundational skills in Software Development Tools ***(Required)***	Level 1 – Follow	Level 1 fits the descriptor: I can do the routine things (clone, commit, push, pull) by following instructions, but the moment something unexpected happens, such as a merge conflict, I need someone to help me out of it. I used Git a fair amount on one project about 12 months ago. The core ideas stuck; the details have not. Also Programming 1, and Programming 2 (48024) including an MVC Tkinter application I demonstrated in person, and Web Systems. Gap: conflict resolution and history rewriting, pull request workflow, GitHub Actions and YAML, project boards and automation, repository hygiene, dependency management. Action: Goal 3 — the Software Development module (GitHub Essentials, GitHub Workflow, GitHub Projects) plus rebuilding the 48024 repository with feature branches, pull requests and a CI workflow (45 hrs).
Python programming (both ads: PetSure “strong Python”; Real Time “expert level SQL and Python”)	Level 2 – Assist	Evidence: Programming 1, and Programming 2 (48024); Python notebook produced for the Introduction to Data Analytics (31250) data exploration and preprocessing assignment. Gap: writing code other people would have to work with. Structure, testing, packaging, code review. Action: addressed through Goals 3 and 4.
SQL, data modelling and schema design (PetSure “strong SQL”; Real Time “design your own schemas”, “model the data warehouse”)	Level 2 – Assist	Evidence: 31271 Database Fundamentals — ER modelling, logical design, normalisation and SQL through to complex joins, subqueries and set operators; the fitness tracking system design assignment (Apple Health case study); SQL lab work across medical and

		PVFC schemas; a supervised SQL test. Gap: dimensional/warehouse modelling and dbt-style transformation layers. Action: work through the dbt Fundamentals free course (dbt Labs) and Kimball dimensional modelling basics in my own time this session; not claimed as credit-bearing learning.
Machine learning — model development, feature engineering and evaluation (SFIA: MLNG)	None — below MLNG Level 2	Central to PetSure (model development, feature engineering, evaluation and optimisation). SFIA 9 defines MLNG from Level 2 upwards, so Level 1 is not available. Evidence: MLNG Level 2 expects supervised participation in preparing data, training and evaluating models. I have done the data preparation side (exploration and preprocessing in 31250) but not yet training and evaluation, so I am below Level 2. I am enrolled in Machine Learning this session. Gap: the full lifecycle, PyTorch/TensorFlow, systematic evaluation and optimisation. Action: the Machine Learning subject produces the model; Goal 4 takes it through to deployment.
Data engineering — pipelines and repeatable transformation frameworks (SFIA: DENG)	None — below DENG Level 2	PetSure: design, build and optimise supporting data pipelines. Real Time: ingest data from raw billing APIs and document repeatable transformation frameworks. Evidence: SFIA 9 defines DENG from Level 2 upwards. My preprocessing workflow for 31250 (Excel workbook plus Python notebook) was a one-off preparation process, not a pipeline that was built, operated or monitored, so I am below Level 2. Gap: orchestration, API ingestion, dbt. Action: build and document one repeatable ingestion and transformation pipeline, starting with the MLflow work in Goal 4, then reassess against the DENG Level 2 descriptor.
Cloud-based ML platforms and modern data ecosystems	None	PetSure: experience working with cloud-based ML platforms and modern data ecosystems. Real Time: Snowflake and dbt. Evidence: none. Action: not closable this session — the three required goals consume the full 6 credit points. Recorded here as the next goal I will take after this subject, once Goal 4 has established local deployment.
Model deployment, monitoring and MLOps	None	The largest single gap identified in this audit. PetSure: developing and deploying production ML systems; MLOps, MLflow, experiment tracking and model registries listed as highly regarded. Evidence: none. Action: Goal 4 — MLflow experiment tracking, serving the model behind a local API, and a model card, completed before the Assessment Task 3 due date.
Stakeholder engagement and communicating technical work in commercial terms	Level 2 – Assist	PetSure: strong stakeholder engagement and communication skills. Real Time: explain complex data models in simple commercial terms directly to customers and stakeholders. Evidence: customer-facing casual work; sales and market research internship; user stories and stakeholder artefacts in Business Requirements Modelling; in-person demonstration of the 48024 application. Gap: communicating model limitations and uncertainty to non-technical audiences.

UTS CRICOS PROVIDER CODE 00099F

		Action: the model card (Goal 4) and the written ethical analysis (Goal 1) are both places where I have to do exactly this.

UTS CRICOS PROVIDER CODE 00099F

Professional Learning Plan

Harsheet Singh Choudhary | Student ID: 25748601

43030 Professional Practice in Computing — Assessment Task 1: Professional Learning Plan

Based on the audit you have just completed you will need to select 1-2 area/s to develop during this subject.

If you have completed a professional certification, that aligns with one of your goals and meets certain criteria, you may be able to receive recognition for this.

*** Goals marked with an asterisks are required. If you already have evidence for any of the required goals please note it in the relevant table below.**

The evidence may need to be submitted as part of your portfolio.

You may need to reword the skills/ criteria into clear goals.

* Goal 1: Demonstrate understanding of ethical principles and practices in a professional context, especially in relation to Indigenous Communities

Consideration	Evidence or Plan
What existing evidence do you already have (if any)?	Nothing formal. I am starting this one from zero. The closest I have come is stakeholder identification and prioritisation in Business Requirements Modelling, which never touched Indigenous engagement, consent or cultural authority.
What skills or knowledge do you need to gain?	The IT code of ethics, and how the ACS Code of Professional Ethics (2023) values — honesty, trustworthiness, respect for others and respect for the profession — constrain machine learning design decisions. Privacy, data protection, intellectual property and copyright as they apply to training data. Indigenous Data Sovereignty, and what Free, Prior and Informed Consent actually requires you to do in practice. How Indigenous data is appropriately collected and researched, and what cultural authority means when a dataset is reused. How to work through a dilemma that has no clean answer and explain why I landed where I did.
What specific steps (and learning resources) will you take to fill this gap?	Wk 4–6 (17 Aug–4 Sep), about 5 hrs/week — Complete the Working Ethically in the IT Industry module: IT code of ethics, privacy and data protection, IP and copyright, emerging challenges, whistleblowers, and the ethical thinking framework. (14 hrs) Wk 7–8 (7–18 Sep), about 7 hrs/week — Complete the Indigenous Professional Capability module: reconciliation and RAPs, Indigenous Data Sovereignty, Indigenous data, Free Prior and Informed Consent, collecting and researching Indigenous data, and the ethical dilemma

UTS CRICOS PROVIDER CODE 00099F

	case study. (14 hrs) Mid Stuvac (21–25 Sep) — Read the AIATSIS guidance on ICIP and the Arts Law Centre ICIP information sheet. (5 hrs) Wk 9 (28 Sep–2 Oct) — Read the ACS Code of Professional Ethics (2023) and the ACS Code of Professional Conduct case studies; map three cases to machine learning scenarios in a short table. (6 hrs) Wk 10 (5–9 Oct) — Write a 1,000-word applied analysis: consent, cultural authority and bias risk in an insurance ML model that uses demographic data. (6 hrs) Measurable outputs: two module completions, a case-mapping table, and the written analysis for the portfolio.
How many hours will this take? *As a rough guide it should be the equivalent of at least 40-50 hours or learning (2 Credit Points).*	45 hours (equivalent to 2 credit points).
Additional information (if required)	Both modules finish before the Drop-in Session 3 on the ethical dilemma (Wk 9) and before Assessment Task 2 on Friday 9 October. This supports the PetSure line about contributing to responsible AI and governance, and the written analysis becomes a portfolio artefact for Assessment Task 3.

* Goal 2: Demonstrate foundational skills in Cybersecurity

Consideration	Evidence or Credible Plan
What existing evidence do you already have?	Not completing a degree or major in Cybersecurity, so the full goal applies. I have never studied security. 41092 Network Fundamentals gave me protocol layers, IP, routing and the link layer, which is the model security controls sit on top of, but the subject had no security content in it. 31271 Database Fundamentals was ER modelling, normalisation and SQL, not access control.
What skills or knowledge do you need to gain?	Security goals and what cybersecurity management involves in an organisation. How to carry out and document a security risk assessment. Cyber threat intelligence: what it is, its processes, and operational security. Secure coding and software security practices, including safe handling of credentials and secrets in repositories. When the Australian Privacy Principles apply to personal information handled by organisations operating in insurance and payments, and what that means for the data I would work with.
What specific steps (and learning resources) will you take to fill this gap?	Wk 4–6 (17 Aug–4 Sep), about 5 hrs/week — Introduction to Cybersecurity module, first half: cybersecurity and cybercrime, recent incidents, security goals, cybersecurity management, security risk assessment and implementation. Complete Assessment 1 quiz (20 pts). (14 hrs) Wk 7–8 (7–18 Sep), about 6 hrs/week — Module second half: cyber threat intelligence, CTI processes, operational security, and secure coding and software security. Complete Assessment 2 quiz (20 pts). (13 hrs) Mid Stuvac + Wk 9 (21 Sep–2 Oct) — Complete Assessment 3: Cybersecurity Incident and Defence Strategies (60 pts). (12 hrs) Wk 10–11 (5–16 Oct) — Apply it, using the OAIC APP Guidelines as the source for the privacy summary: threat model my Programming 2 (48024) application, move hard-coded configuration to environment variables, add .gitignore rules, and write a one-page summary of Australian Privacy Principles obligations for payments and insurance data. (6 hrs) That leaves me with two quiz results, the incident and defence strategies submission, a threat model document and a refactored repository as evidence.
How many hours will this take? *As a rough guide it should be the equivalent of at least 40-50 hours or learning (2 Credit Points).*	45 hours (equivalent to 2 credit points).
Additional information (if required)	PetSure explicitly values regulated-environment experience. Real Time works with multi-gateway payments and raw billing data, which is where privacy obligations are most likely to bite, though the ad does not name a regime. The three graded module assessments also give me evidence I can actually show in the portfolio.

* Goal 3: Demonstrate foundational skills in Software Development Tools

Consideration	Evidence or Credible Plan
What existing evidence do you already have?	Not completing a major in enterprise software development, so the full goal applies. I used Git a fair amount on one project about 12 months ago. The core ideas stuck; the details have not. Also Programming 1 and Programming 2 (48024), including an MVC Tkinter application I demonstrated in person, and Web Systems.
What skills or knowledge do you need to gain?	Confident Git operation beyond the basics: resolving conflicts, and knowing when to use abort, revert, amend, reset and logging instead of guessing at them. A pull request workflow using feature branches. At the moment I commit straight to main. GitHub Actions and YAML well enough to write a workflow that runs automatically on push. GitHub Projects: operations, automations, and moving issues on pull request merge, so the repository tracks the work and not only the code. Repository hygiene and reproducibility: README, .gitignore, virtual environments and pinned requirements.
What specific steps (and learning resources) will you take to fill this gap?	Wk 4–6 (17 Aug–4 Sep), about 5 hrs/week — Software Development module, GitHub Essentials: setup, configurations, resolving conflicts, and abort/revert/amend/reset/logging. Complete the activities and Quiz 1 (10 pts). Introduction to Visual Studio Code. (16 hrs) Wk 7–8 (7–18 Sep), about 6 hrs/week — GitHub Workflow topic, including YAML, and build a working workflow using the official GitHub Actions quickstart. (12 hrs) Mid Stuvac + Wk 9 (21 Sep–2 Oct) — GitHub Projects: operations, automations, moving

	issues on PR merge, and the associated activities. (9 hrs) Wk 11–12 (12–23 Oct) — Apply it: rebuild the 48024 card game repository with feature branches and at least three merged pull requests, add a README, .gitignore, virtual environment and pinned requirements, and configure a GitHub Actions workflow that runs unit tests on every push. (8 hrs) Measurable outputs: module completion and Quiz 1 result, and a public repository with visible branch and pull request history and a passing CI workflow.
How many hours will this take? *As a rough guide it should be the equivalent of at least 40-50 hours or learning (2 Credit Points).*	45 hours (equivalent to 2 credit points).
Additional information (if required)	PetSure asks for experience developing and deploying production ML systems; Real Time asks for repeatable, documented transformation frameworks. Neither is possible without this. The rebuilt repository is what I would show.

Goal 4: Build foundational capability in model deployment and MLOps

Consideration	Evidence or Credible Plan
What existing evidence do you already have?	None at all. My audit puts this at the bottom of everything I rated, and both ads ask for it: PetSure lists developing and deploying production ML systems, with MLOps, MLflow, experiment tracking and model registries highly regarded. I am doing Machine Learning this session, so the model this goal needs is one I have to build anyway.
What skills or knowledge do you need to gain?	Experiment tracking and model versioning using MLflow. Packaging a trained model and serving it behind a local API. Writing a model card documenting evaluation metrics, limitations and responsible-AI considerations. What cloud deployment would take on top of this, so I can scope it as my next goal.
What specific steps (and learning resources) will you take to fill this gap?	Wk 11 (12–16 Oct) — Instrument the model from my Machine Learning subject with MLflow, following the official MLflow Tracking quickstart. (5 hrs) Wk 12 (19–23 Oct) — Package the trained model behind a FastAPI endpoint and test it locally, following the official FastAPI tutorial. (5 hrs) End Stuvac (26–30 Oct) — Write a model card covering evaluation metrics, limitations and the responsible-AI considerations developed in Goal 1, and add it to the portfolio. (5 hrs) Evidence at the end: an MLflow run history, a working local endpoint, and the model card.
How many hours will this take? *As a rough guide it should be the equivalent of at least 40-50 hours or learning (2 Credit Points).*	Approximately 15 hours. Goals 1–3 supply the required 6 credit points (3 × 2 CP). These 15 hours are additional development I am choosing to do, and are not counted towards the credit-point total.
Additional information (if required)	Finishes by the end of Final StuVac, so the evidence is in the portfolio before Assessment Task 3 on Monday 2 November. It also gives me somewhere to put Goals 1–3 to use once the modules are finished. Everything I am using is free and open source, so there is nothing to get approved.

At PetSure, we're building machine learning capability that improves outcomes for pets, pet parents and our partners. We're looking for a Senior Machine Learning Engineer to help take our AI and ML capability to the next level by designing, deploying and scaling production-grade machine learning solutions.

About the role

Reporting to the ML Solutions Manager, you'll be a hands-on technical leader responsible for developing and delivering machine learning solutions that drive measurable business

outcomes. You'll work across the full ML lifecycle, from problem definition and model development through to deployment, monitoring and continuous improvement.

This is not a research-only role. You'll build production-ready solutions that solve real business problems while helping shape PetSure's AI and ML practices.

Key responsibilities include:

- Lead end-to-end machine learning development from concept through to production deployment.
- Design, build and optimise ML models and supporting data pipelines.
- Develop predictive analytics solutions that drive commercial and customer outcomes.
- Establish and uplift modelling standards, frameworks and best practice.
- Mentor and support other ML practitioners.
- Partner closely with MLOps Engineers, AI Engineers and business stakeholders.
- Contribute to responsible AI, governance and scalable ML foundations.
- Leverage AI-assisted development practices to accelerate delivery and innovation.

About you

You are an experienced ML Engineer who combines strong technical depth with commercial pragmatism.

You'll likely bring:

- 5+ years' experience in machine learning, data science or related disciplines.
- Strong Python and SQL capability.
- Experience developing and deploying production ML systems.
- Expertise across model development, feature engineering, evaluation and optimisation.
- Experience working with cloud-based ML platforms and modern data ecosystems.
- Strong stakeholder engagement and communication skills.
- A passion for mentoring and uplifting technical capability.
- Tertiary qualifications in Computer Science, Data Science, Engineering, Statistics or a related discipline.

Highly regarded:

- MLOps experience.
- Experience with LLMs and Generative AI.
- Feature stores, MLflow, experiment tracking or model registries.
- PyTorch or TensorFlow.

- Experience in regulated environments such as insurance, financial services or healthcare.

Why PetSure?

At PetSure, our vision is a world that is better for pets and their people. We are passionate about improving pet healthcare moments and removing the worries that come with being a pet owner.

You'll join a team where:

- AI and machine learning are strategic priorities.
- You can work on meaningful problems with real-world impact.
- Technical excellence is valued and encouraged.
- Hybrid working is supported.
- You'll have the opportunity to influence the future direction of our ML capability.

If you're excited by the opportunity to build production AI and machine learning solutions that make a genuine difference, we'd love to hear from you.

Employer questions

Your application will include the following questions:

What motivated you to apply for the position of Senior Machine Learning Engineer, and what excites you about joining PetSure?

Please provide your base (annual) salary expectations:

What is the notice period for your current employment?

Do you love pets?

If applying for a position based in Australia, please confirm your eligibility to work in Australia:

If you have been referred to the Senior Machine Learning Engineer by an employee of PetSure, please let us know who that was:

All our roles roles require a criminal history check to be performed as part of the recruitment process for shortlisted candidates. Please acknowledge that you are aware of this and are willing to participate if needed.

Are you of Aboriginal or Torres Strait Islander origin?

How do you describe your gender identity?

Do you have accessibility requirements or need to discuss an adjustment in order to attend a face to face interview or an online interview?

I have read, understood and consent to the privacy statement.

Tired of building internal dashboards? Come build the analytical engine that customers run their businesses on.

Step into a high agency, 0-1 role as a **Founding Product Data Scientist** for an **elite, stealth stage FinTech startup** who are modernizing global billing & monetization infrastructure!

You'll work side by side with an exceptional founding team of leaders who previously led hyper-scale transactional engineering and monetization platforms for a global tech giant, giving you a masterclass in hyper-scale product development.

Join a culture that is built on high momentum, deep tech curiosity and low ego, while working with a collaborative hybrid in-office team in Sydney, brainstorming and whiteboarding in real-time.

If you're a self-sufficient **Senior to Staff level IC** who loves building from scratch, happily owns data engineering pipelines and wants to see their insights directly drive product strategy and customer success... this is a great fit for you!

What your day to day will look like:

- Build the DW by designing, modeling, and maintaining the foundational data architecture using **SQL, Python, Snowflake, and dbt**.
- Diagnose payments friction by diving directly into raw, multi-gateway transactional payments data from early beta partners to identify gateway decline patterns and checkout failures.
- Analyse user acquisition funnels and subscription signup-to-paid behaviors to locate and patch revenue leakage.
- Design client-facing features by collaborating closely with product and design folks to translate payments data into automated, customer-facing optimization alerts inside our user portal.
- Drafting and documenting repeatable data transformation frameworks to automate and scale our data strategy from the ground up.

What you will bring to the team:

- Strong quantitative background w/ hands-on experience as a **Senior to Staff level** Data Scientist, Product Data Scientist Analytics engineer, Data engineer, Product analyst etc.
- **Expert level SQL and Python**
- Experience working w/ **Payments, subscription billing or transactional growth funnels**
- Technical self-sufficiency to design your own schemas & ingest your own data from raw billing APIs
- Excellent communicator with the ability to explain complex data models in simple commercial terms directly to customers and stakeholders

Nice to have:

- For Staff level DS - Experience building with dbt & Snowflake is highly valued (we're also happy to support a Senior DS who wants to move into this).

What's on offer?

- Top tier remuneration: **$155K up to $200K base + super + equity** (dependent on your data pipeline & architecture depth)
- Elite Network Exposure: Learn how monetization scales across other high-growth tech startups in our VC network, not just your own
- A permanent, highly collaborative workspace located in the heart of **Sydney's tech hub**; **Hybrid 3 days onsite/2 days WFH setup**

Don't miss out on this amazing opportunity, **Apply Now!**
